

# Evaluación de rendimiento de los servidores eIDAS

**Prof. Jesús Carretero**  
**Universidad Carlos III of Madrid**

- Adoption of the EU Regulation No. 910/2014, the so called eIDAS Regulation.
  - The Connecting Europe Facility (CEF) has proposed an identity federation solution
- The federation solution is based in federated operators called **eIDAS Nodes**.
- ***Very ambitious approach***: cross-border authentication using national eID Scheme with same legal status as traditional processes.
  - There is a need to create a trust network to perform cross-border e-Identification processes for legal persons.

# eID<sup>4</sup>Spain eIDAS Deployment

- A network of eIDAS Nodes being deployed at European level.
  - Each Member State is deploying a eIDAS Node.
- The national electronic identification scheme (eID Scheme) of each country is subscribed to this node in the role of Identity Provider.
- Public Service Providers participating in the network also subscribe to the node.

## BENEFITS

*The eIDAS Node...*

- handles attributes of natural persons (family name, date of birth, etc.)
- handles attributes of legal persons (legal name, legal identifier, etc.)

***... according to the eIDAS Regulation!***

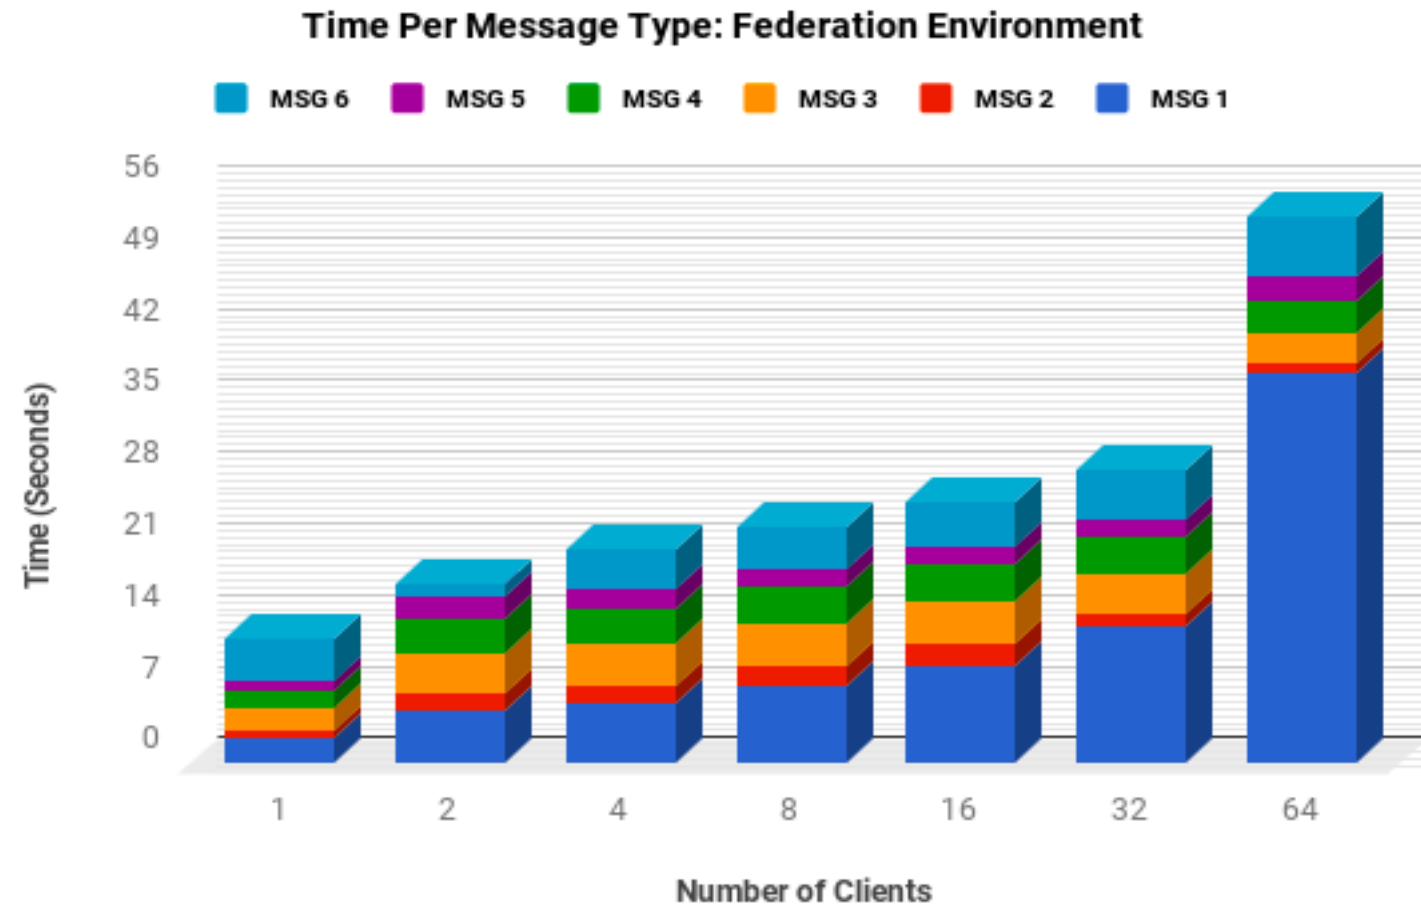

## LIMITATIONS

*However...*

- Only public services can be consumed by natural persons.
- There is no actual solution for legal persons, which are, organizations not linked to the public sector.

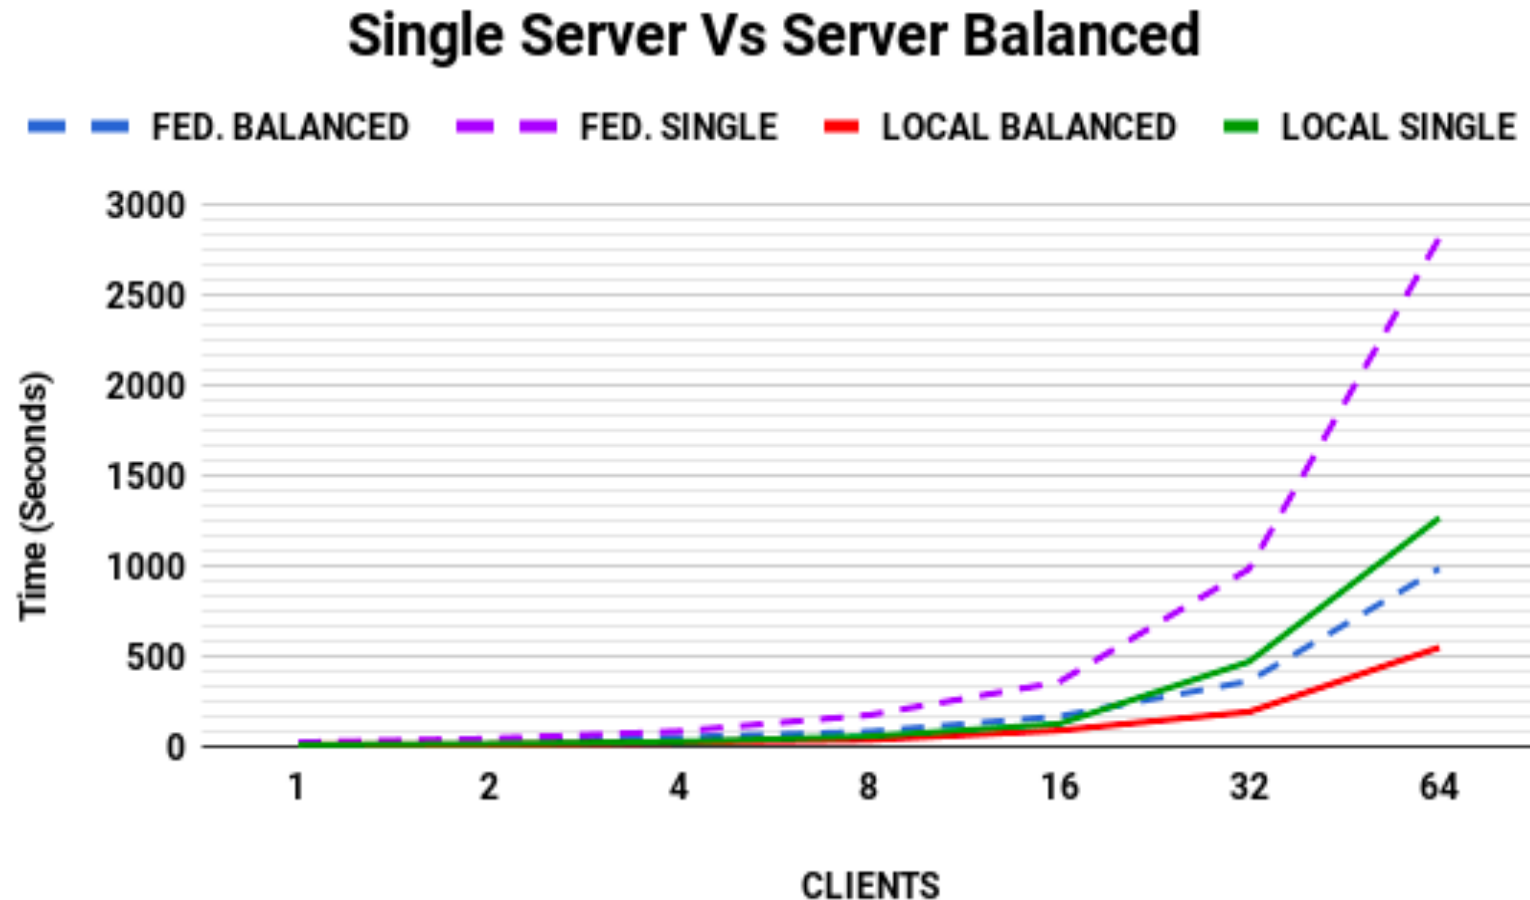

- Serial
  - One request per time
- Load balancing
  - Several replicas created
  - Requests distributed in round robin to replicas

# eID4Spain Performance Evaluation of eIDAS Servers

# eID4Spain Testing scalability using load balance

- 3000 ID requests per client

- eIDAS enables the identification of citizens and legal entities throughout Europe using the regulation 910/2014.
- Reduced costs of creating and maintaining eIDAS compliant software components.
- Reduced learning curve for adopters interested in taking part in the eIDAS Network.
